CHARLES EMUZE

Saskatoon, Saskatchewan, Canada | coemuze@gmail.com

PROFESSIONAL SUMMARY

Cybersecurity and enterprise technology professional with experience spanning security engineering, cloud security, enterprise infrastructure, identity and access management, security monitoring, network security, technical assessment, and executive communication. ISC2 Certified Cloud Security Professional (CCSP) with an MSc in Enterprise Cybersecurity focused on AI-powered intrusion detection within post-quantum cryptographic environments. Hands-on experience implementing and assessing security controls across Windows, Active Directory, Linux, Docker, network segmentation, endpoint management, SIEM, authentication, encrypted communications, and security monitoring environments. Experienced in translating complex technical findings, threat information, and security risks into actionable recommendations and executive-level briefings. Strong interest and demonstrated research experience in AI security, AI-enabled threat detection, security automation, cloud-native security, cryptography, identity architecture, and the secure adoption of emerging technologies.

CORE COMPETENCIES

Security Architecture • Security Engineering • Cloud Security • AI Security • AI Governance • Identity and Access Management (IAM) • Authentication & Authorization • Network Security • Zero Trust Principles • Cryptography & Key Management • Data Protection • Security Monitoring • Incident Response • Threat Detection • Threat Modeling • MITRE ATT&CK • Security Assessments • Risk Management • Security Controls • Security Architecture Documentation • Trust Boundaries • Data Flows • Container Security • Docker • Linux Security • Windows Security • Active Directory • Endpoint Security • SIEM • Wazuh • OSINT • Security Automation • Executive Briefings • Technical Documentation • Stakeholder Engagement

CERTIFICATIONS

- AI Security Fundamentals
- LLM Security
- ISC2 Certified Cloud Security Professional (CCSP)
- CompTIA Cybersecurity Analyst (CySA+)
- CompTIA Security+
- ITIL v4
- Project Management Professional (PMP)

EDUCATION

- MSc Enterprise Cybersecurity
  Open Institute of Technology (OPIT), 2026
- Post-Graduate Diploma, Management
  Ahmadu Bello University, 2013
- Bachelor of Engineering, Electrical and Electronics Engineering
  Madonna University, 2008
- CISSP Preparation Course
  Seneca College, 2023

PROFESSIONAL EXPERIENCE

CAMECO CORPORATION
Information Technology / Enterprise Technology Professional

Saskatchewan, Canada | Current

Support enterprise technology and security operations within a major organization operating in the highly regulated energy and critical-infrastructure sector.

- Administer and support Windows enterprise endpoints, including operating-system installation, imaging, software deployment, patching, configuration, and lifecycle activities.
- Perform Active Directory account administration supporting enterprise identity and access management processes.
- Support endpoint-management and security operations using Microsoft SCCM and Intune.
- Troubleshoot endpoint, hardware, peripheral, application, authentication, and network-access issues in an enterprise environment.
- Support remote users and enterprise systems while considering security, access-control, availability, and operational requirements.
- Work with enterprise identity, authentication, endpoint security, networking, and infrastructure technologies across interconnected environments.
- Apply cloud-security, identity, risk-management, and security-control concepts gained through CCSP certification and cybersecurity graduate study to enterprise technology challenges.
- Collaborate with technical teams and business users to translate operational requirements into practical technology solutions.
- Maintain familiarity with enterprise voice and communications technologies, including Cisco VoIP and managed SIP-based collaboration services.

REAL BROADCASTING NETWORK
Technology / Cybersecurity & Technical Advisory Role | Concurrent

Provide technology, cybersecurity, infrastructure, technical assessment, and executive advisory support within a broadcast and media organisation.

- Conduct open-source intelligence and cybersecurity research using authoritative and public sources including CISA advisories, public DNS information, technology intelligence, and publicly available security information.
- Analyse technical and cybersecurity information and translate findings into concise assessments and recommendations for leadership.
- Produce executive briefings communicating technology risk, security implications, architecture options, and recommended actions.
- Evaluate enterprise infrastructure, networking, storage, communications, streaming, and security requirements and develop practical architectural recommendations.
- Support security-conscious infrastructure design involving network segmentation, centralized services, remote connectivity, and resilient systems.
- Engage technical staff and organizational leadership to clarify requirements, assess risks, and guide technology implementation decisions.
- Develop technical documentation, implementation guidance, operating procedures, and architectural recommendations for infrastructure initiatives.

CHANNELS TELEVISION
Technical / Technology Operations Experience

- Performed technical research and open-source information analysis to support operational and technology decision-making.
- Distilled complex information from multiple public sources into assessments suitable for operational and leadership audiences.
- Worked across technical and non-technical teams in a high-availability broadcast environment where resilience, communications, and operational continuity were critical.
- Developed experience communicating technical concepts to stakeholders with different levels of technical expertise.
- Integrated centralized logging, endpoint protection and audit trails; developed security policies and trained technical and nontechnical teams.

TECHNICAL PROJECTS AND RESEARCH

Mobile Device Management

- Designed and validated an iOS MDM pilot integrating ManageEngine and Apple Business Manager, implementing supervised enrollment, mandatory passcodes, group-based policies, and automated broadcast-app deployment to support planned mobile-device rollout.

Enterprise Security & SOC Environment

Designed and implemented a segmented enterprise-style cybersecurity environment combining identity, network security, endpoint monitoring, virtualization, security telemetry, and attack simulation.

Security Architecture & Network Segmentation

- Designed segmented security architecture using dedicated management, server, client, security, infrastructure, and attack-lab network zones.
- Configured VLAN segmentation, routing, firewall transit, trunking, and controlled communication between security zones using enterprise Cisco infrastructure.
- Applied principles of network isolation, trust boundaries, attack-surface reduction, and defense in depth.

Identity & Access Management

- Deployed and administered Microsoft Active Directory Domain Services in a Windows Server environment.
- Implemented organizational units, administrative and standard-user separation, workstation organization, role groups, and domain authentication.
- Integrated Windows endpoints with centralized identity infrastructure and internal DNS services.
- Applied IAM concepts involving administrative separation, authentication, authorization, account management, and endpoint trust.

Security Monitoring & Detection

- Deployed Wazuh SIEM/XDR infrastructure for centralized security monitoring and endpoint telemetry.
- Integrated Windows and Linux systems with security monitoring agents.
- Implemented file-integrity monitoring, security configuration assessment, endpoint telemetry, application logging, and event analysis.
- Integrated Nginx and Docker application logs into security monitoring workflows.
- Validated security events by generating controlled activity and reviewing resulting telemetry and alerts.

- Applied detection-engineering concepts involving telemetry validation, alert investigation, log-source integration, and security-event analysis.

Security Testing & AI-Assisted Security

- Maintained an isolated attack and security-testing environment for evaluating defensive controls and security telemetry.
- Use deliberately vulnerable applications for authorized security experimentation, detection validation, and defensive security research.
- Explore AI-assisted cybersecurity analysis and security-testing workflows with emphasis on authorization, human oversight, validation of findings, and appropriate security guardrails.

Security Architecture & AI Security Experience

- Analyze systems in terms of identity, network boundaries, trust relationships, authentication, authorization, encrypted communications, telemetry, and security controls.
- Create technical architectures and implementation documentation illustrating systems, network relationships, segmentation, services, and security dependencies.
- Apply threat-informed thinking using security telemetry, adversary behavior, system exposure, and control effectiveness.
- Familiar with MITRE ATT&CK concepts for understanding adversary techniques and defensive detection opportunities.
- Research emerging AI-security issues including AI-assisted cyber operations, security automation, autonomous/agentic security tooling, human oversight, and governance.
- Evaluate how artificial intelligence can enhance threat detection and security analysis while maintaining appropriate authorization, validation, and human decision-making.
- Understand foundational risks associated with emerging AI systems, including inappropriate tool authorization, excessive privileges, untrusted inputs, data exposure, and the need for governance controls.

LEADERSHIP & COMMUNICATION

- Communicate cybersecurity, architecture, technology risk, and operational issues to both technical specialists and executive stakeholders.
- Produce executive briefings, assessments, technical recommendations, implementation documentation, and operational guidance.
- Translate technical findings into business impact, risk implications, options, and recommended actions.
- Coordinate across technical teams and organizational stakeholders to resolve infrastructure and security issues.
- Combine engineering, cybersecurity, management, and communications experience to bridge technical and business perspectives.

PROFESSIONAL INTERESTS

Cloud Security • Applied Security Engineering • Security Architecture • AI Security • AI Governance • Identity Security • Secure Cloud Adoption • Threat Detection • Cybersecurity Automation • Emerging Technology Risk • Critical Infrastructure Security
